

Abstract

Man-made vitreous fibres have a solubility of pH 4.5 of at least 20nm per day and a melt viscosity of 10 to 70 poise at 1400°C. Novel fibres contain at least 18% Al₂O₃.

- 5 Particular products include external wall insulation or cladding and pipe sections. A composition for making suitable fibres may be selected by determining solubility at pH 4.5 or in macrophage.
